

ALEJANDRO CARLON LEYVA

US Citizen | 602-448-1574 | Alex.carlon26@gmail.com | github.com/AlejandroCarlon03 | LinkedIn

EDUCATION

Arizona State University
Bachelor of Science in Software Engineering

Tempe, AZ
Expected May 2028

EXPERIENCE

Software Engineering Intern
Diamond Kitchen and Bath Inc.

Phoenix, AZ
May 2026 – Present

SnipeSync | C#, .NET 9, Azure Functions, Microsoft Graph API, Azure Storage Queues | GitHub

- Developed **SnipeSync**, a production .NET 9 Azure Function suite automating identity and asset-lifecycle sync for 150+ employees between Microsoft Entra ID and Snipe-IT via Graph and **REST** APIs - provisioning new hires and offboarding departures by reclaiming their assets, license seats, and accessories - saving hours of manual on/offboarding work.
- Refactored duplicated API and offboarding logic into a shared, dependency-injected service layer (**ISnipeItService**, **IOffboardingService**) reused by scheduled and queue-triggered functions, cutting duplicate code by roughly 30%.
- Hardened production reliability with a Polly retry policy (honoring **Retry-After**) and a queue-backed dead-letter reconciliation flow (Azure Storage Queues) to eliminate an API rate-limiting cascade, and resolved an Azure Storage provisioning issue that had stalled rollout for over a week - restoring scheduled execution against live Entra data.

Systems Health Dashboard | Java 26, Spring Boot 4, React, TypeScript, Gradle, H2 | GitHub

- Built a full-stack operational health dashboard using **Spring Boot 4** and **React** that aggregates infrastructure and business metrics from multiple enterprise systems into a unified real-time view.
- Designed scheduled polling, in-memory caching, and fault-tolerant aggregation services that normalize data from **Snipe-IT** and **Odoo**, gracefully degrading when upstream services fail instead of interrupting API availability.
- Developed REST APIs and an interactive React dashboard exposing system health, historical uptime, and status timelines using a layered architecture separating clients, services, schedulers, controllers, and domain models.

AI Phone CRM Integration | JavaScript, Retell-AI, GPT, Zapier, Odoo CRM | GitHub

- Designed and iteratively refined the prompt engineering and conversational logic for a GPT-based (Retell AI) voice agent handling an estimated 60+ calls/month, including structured entity extraction (caller intent, ZIP code, job type) from unstructured speech to drive downstream automation.
- Engineered call-routing logic distinguishing new vs. existing customers, correctly auto-routing over an estimated 95% of calls, and built Zapier webhook workflows with pre-call CRM enrichment integrating Odoo CRM, eliminating manual data entry.

PROJECTS

Slay the Spire 2 Analytics Dashboard | Python, Streamlit, Plotly, PySide6, pandas, SQLite | GitHub

- Built a save-data analytics engine parsing hundreds of run logs into a shared **pandas** core driving both a six-page Streamlit/Plotly dashboard and a PySide6 desktop app packaged as a one-file Windows executable; ranked card win-rate impact with Wilson confidence intervals against character-matched baselines, backed by over a 100 **pytest** tests.

TECHNICAL SKILLS

Languages: C#, Java, C++, Python, SQL, JavaScript

Frameworks & Technologies: .NET 9, Azure Functions, Microsoft Graph API, REST APIs, Azure, Docker, PowerShell, Git

Concepts: Object-Oriented Programming, Dependency Injection, Cloud Computing, API Integration, Identity & Access Management, Data Structures, Algorithms
